

SDN302 - LAB 02

Subject: SDN302

Total: 10 points

INSTRUCTIONS

- Continue the Express project and the **Lab1** database from Lab 01.
- Choose one template engine - EJS, Handlebars, or Pug - and use it with Express to build the client application.
- Use the existing **suppliers** and **products** collections, and add a **managers** collection.
- Field validation is not required in this lab. It will be implemented in Lab 03.

IMPORTANT

- Keep **PORT** and **MONGODB_URI** in the .env file.
- Use the sample data in the Lab1 database and create a manager account to demonstrate the application.

SCENARIO AND DATABASE SCHEMA

Build a manager-facing client application for products from Lab 01. Each product references one supplier. Product fields are name, category, price, stock, tags, isActive, and supplier. Store manager accounts in the new managers collection with code and pass fields.

Task 01 (10.0 points) - Manager Client Application for Product Management

1. Manager Login (2.0 points)

- Show a login page at **/auth/view** with fields for manager code and password.
- Check the submitted code and password against the **code** and **pass** fields in the **managers** collection. Show an error message if they do not match.
- After a successful login, redirect the manager to **/admin/products**. Product management pages and actions are available after login.

2. Display Product List (2.0 points)

- Display all products in a card layout.
- Each card must show the product name, category, price, stock, tags, active status, and supplier name.
- Route path: **/admin/products**.

3. Delete Product (1.5 points)

- Allow the user to delete a selected product after confirmation.
- On success, redirect to the product list and show a success notification. On failure, show an error notification.

4. Add New Product (2.5 points)

- Allow the manager to add a product using a modal form on the product list page.
- Include controls for name, category, price, stock, and isActive.
- Show **supplier** as a dropdown populated with suppliers from the **suppliers** collection. Save the selected supplier ID.
- Use a text input for **tags**. The manager enters comma-separated values; for example, **a,b,c** must be saved as **["a", "b", "c"]**.
- On success, redirect to the product list and show a success notification. On failure, keep the add form open and show an error notification.

5. Update Product (2.0 points)

- Allow the manager to open an edit form showing the current product values and save changes.
- Use a supplier dropdown and preselect the product's current supplier. Show existing tags as comma-separated text in the tags input, then save edited tags as an array.
- Route path for viewing and editing a product: **/admin/products/:id**.
- On success, redirect to the product list and show a success notification. On failure, keep the edit form open and show an error notification.
